

WE HAVE THE SOLUTION.

In other words, we have everything you need to protect, restore and conserve rivers, lakes and every kind of watercourse.

A comprehensive range of specialist skills and services; in-depth expertise on the optimum management of rivers and lakes; the ideal blend of traditional materials and methods with the latest engineering techniques and technologies: the requisite resources, both people and plant, to successfully handle the biggest of jobs.

- All marked by an abiding commitment to quality.
- All undertaken in accordance with the demanding regulatory requirements.
- And all at your command when you work with Willowbank.

CONSTRUCTIVE IDEAS. SUSTAINABLE SOLUTIONS.

We have practical experience of a wide range of waterside techniques, including

- **willow spiling and reinforced spiling**
 - gabions
 - piling
 - marginal aquatic planting
 - faggots and coir
 - blockstone
 - reinforced earth
 - timber revetment
- and wherever required, we can also provide specialist skills such as
- **water quality testing**
 - silt analysis
 - **controlled waste disposal**
 - **complete understanding of the regulatory framework to secure permissions, permits, licences and exemptions required for waste management activities from recycling to resource recovery**

We also have all the requirements to meet government and local authority standards, including

- **professional indemnity insurance**
- **health & safety certification**
 - method statements
 - environmental policy
- **third party and employer's liability**
 - engineering designs
 - ethical procurement

WE HAVE THE RESOURCES...

OUR GREEN HERITAGE

To date, the projects we've worked on have offset the equivalent yearly carbon dioxide emissions of more than 14,000 cars

We have our own well proven way of working

Whatever you want us to do, our involvement will invariably follow a well-practised, well-proven course.

We'll start with an initial discussion, outlining your options and offering expert help and advice. A site visit will probably follow, when we'll assess the precise nature of the problem, quantify the work that needs to be done, and decide on the optimum design solutions for the task.

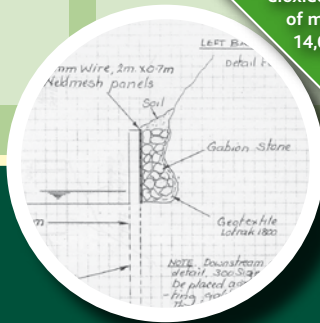

Once we understand the real requirements, we'll set to work on the solution, liaising with the Environment Agency and other regulatory bodies where necessary, developing designs that meet their stringent standards and your expectations.

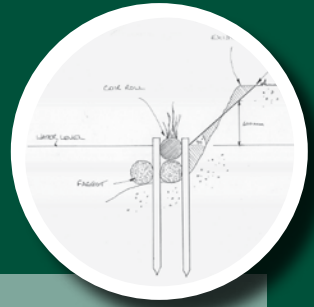

All the essential expertise

If the problem's structural failure, our river engineers will have a significant input – assessing what's gone wrong, why it's happened and identifying all the other factors which could have an effect on what we plan.

We'll use their design as the basis of our estimate – and once you've approved the timescale and likely cost, our skilled team of specialists will soon be on site to put our ideas into action.

OUR GREEN HERITAGE
 To date, the projects we've worked on have offset the equivalent yearly carbon dioxide emissions of more than **14,000 cars**

All the resources you need

We can provide heavy plant and machinery to tackle large-scale projects; undertake composite solutions incorporating gabions or reinforced earth, piling or blockstone; combine hard engineering with natural elements such as willow spiling and faggots, and finish off with turf and marginal planting to create a waterside environment that's everything nature intended.

And having done all that, we'll double-check every aspect of the work – involving you in the process so you're completely happy with the outcome.

The result? A natural, sustainable solution that will stand the test of time; that combines the best of traditional and modern methods; that encourages wildlife, enhances recreational value and meets economic and environmental concerns equally well.

Now, doesn't all that make you think Willowbank is the natural choice?
